

Technical Data Sheet

CROSpatch® 340 HB

High Build Repair Mortar

CROSpatch® 340 HB is a high build, high strength, polymer modified, fibre reinforced, shrinkage compensated repair mortar.

Recommended Uses:

- Suitable for repairing concrete in horizontal, vertical, and overhead applications.
- Ideal for repairs requiring high compressive strength.
- Repairs to spalled or damaged concrete in buildings, bridges, and infrastructure.
- Suitable for high build applications, thicknesses up to 50mm for vertical applications, and 40mm for overhead applications.
- Can be wet sprayed, allowing for heavier builds of up to 100mm on vertical surfaces.

Advantages:

- **CROSpatch® 340 HB** is classified as Non-Hazardous with respect to Respirable Crystalline Silica (RCS) as it contains less than 0.1% RCS.
- Fibre reinforced to provide optimal strength and performance.
- High compressive strength – typically 50MPa.
- High Flexural Strength – typically greater than 8 MPa.
- Can achieve high build repairs in a single application.
- Shrinkage compensated, provides long term dimensional stability.
- Polymer modified, excellent adhesion and low permeability to water, CO₂, and chloride ions.
- Can be applied by wet spray process, providing higher builds compared to hand application.

Surface Preparation:

All surfaces must be structurally sound, clean, and dry. Surface must be free from dust, dirt, wax, grease, asphalt, latex and gypsum compounds, adhesives, paint, curing and sealing compounds and other contaminants which may act as a bond breaker. Any cracked or weakened surface should be removed and repaired to provide a solid foundation. It is

recommended that for large areas a minimum depth of 10mm be prepared as to avoid excessive feather edging or skim coating. If required, cut all edges of the recess to be repaired with a concrete cutting tool, ensuring a straight edge where a minimum depth of 10mm is achieved.

If any corroded steel is present remove all loose scale and corrosion/rust deposits. Grit blasting is effective in removing corrosion, and all steel including re-bars should be cleaned to a bright condition. Immediately after cleaning steel, the steel should be treated with a suitable zinc rich primer. This will stop further oxidation and corrosion.

Substrate Priming:

On a well prepared and roughened substrate a bonding primer is generally not required. Ensure the surface is saturated with water, but must be dry on the surface, with no presence of any residual surface water.

A bonding primer is required when trying to achieve improved build thickness. We recommend the use of **CROSflow® Primer**. Apply the primer to the surface, and before the primer dries, and whilst it is still tacky, apply the **CROSpatch® 340 HB**. If the **CROSflow® Primer** dries before the mortar is applied, it is important that a fresh coat of primer be applied, and that the mortar be applied whilst it is still tacky.

Mixing:

1. **CROSpatch® 340 HB** must be mechanically mixed using a forced action high shear mixing paddle. Do NOT mix by hand, as this can have a significant impact on the consistency, application properties and ultimate strength of the product. Do NOT use a free fall mixer to mix this product.
2. We always recommend mixing only full bags of product. If part bags are to be used for small jobs, ensure the product and appropriate amount of water are weighed out using accurate scales, to maintain the proper mix ratio.
3. Place 3.0 – 3.4 litres of potable water per 20kg bag, into a clean appropriate mixer
4. Start mixer and add **CROSpatch® 340 HB** gradually while mixing.
5. After the addition of all the powder, continue mixing for 2-3 minutes to ensure proper activation of additives and optimal product performance.
6. Do Not add excess water – it will reduce strength, extend drying time, and alter the application properties.

Placement:

Apply the mixed **CROSpatch® 340 HB** to the prepared substrate by gloved hand or trowel. First, work a thin layer of the mortar into the primer or pre-soaked substrate and then build the mortar on to this layer.

Thoroughly compact the mortar into the prepared and primed substrate and around the exposed steel reinforcement and re-bars. A smooth surface can be obtained using a steel trowel. Ensure not to overwork the surface. The **CROSpatch® 340 HB** can be applied in thickness up to 50mm on a vertical surface in a single application, or on an overhead surface up to 40mm in a single application. Thicker sections must be

built up in layers, to avoid slumping. In some circumstances, higher builds can be achieved in a single application, depending on the configuration of reinforcing steel.

Building of multiple layers should be done by allowing the first layer to set (approx 5-6hrs), providing a scratch coat on the surface and then priming with **CROSflow® Primer**. Ensure the primer is still tacky when the additional layer is applied. For spray applications, higher builds can be achieved. For additional information on spraying, contact Crosbe Technical Services.

Curing:

Curing should be conducted in accordance with good concreting practice. Crosbe recommend the use of a suitable curing compound, which needs to be compatible with any subsequent coating being applied over the mortar. Consult the supplier of the curing compound or contact Crosbe Technical Services if unsure.

Temperature Consideration:

The mechanism of interaction between cement and water is temperature sensitive. The set time is delayed at low temperatures and is accelerated at high temperatures. To avoid significant change in setting times, the recommended water temperature, ambient and substrate temperature ranges are:

Water Temperature Range: 15 – 25°C. Working with temperatures outside of this range will also impact the fluidity of the product.

Ambient Temperatures: Do not apply at a temperature less than 5°C. For temperatures down to 5°C it is suggested to use warm water (up to 25°C) to help accelerate cure under these conditions. Above 30°C, consider using cooled water (down to 15°C) for mixing the product. Do not apply in temperatures above 35°C. Substrate Temperature: Do not apply onto a surface which has a temperature less than 5°C or above 35°C.

CROSpatch® 340 HB – Product Data:

Property	Test Method	Result
Compressive Strength	AS1478.2	24 Hours: 20 - 24 MPa 7 days: 38 - 42 MPa 28 days: 50 - 54 MPa
Flexural Strength	AS1012.11	>8 MPa @ 28 days
Setting Time	AS1012.18	Initial Set - 4 Hrs. Final Set - 5 Hrs.
Fresh Wet Mix Density	AS1012.5	1750 kg/m ³
Drying Shrinkage	AS1478.2	< 600 Microstrains @ 28 days
Yield		Approx. 13.3L from a 20Kg bag mixed with 3.2L water

The performance data is typical and based upon controlled laboratory conditions, with product mixed at 16% water. Actual performance on the job site may vary from these values based on actual site conditions.

Packaging:

20kg Polyethylene (PE) bags,

Shelf Life & Storage:

Shelf Life

The shelf life of the product is 18 months from the date of manufacture, if stored indoors in accordance with recommended storage conditions.

Storage

Store in dry conditions, in unopened and undamaged PE bags and in temperatures below 30C. If stored in excessive temperature conditions, externally exposed to the elements or in high humidity conditions, the shelf life may be reduced.

Safety Data:

This product may cause irritation and an allergic reaction to the skin. It may cause serious eye injury and irritation to the respiratory system. In case of contact with the eyes rinse with running water (15 mins) including removal of contaminated clothing. Wear protective gloves, clothing, eye, and face protection. Avoid inhaling dust/ fume/gas/mist/vapours/spray. Ensure
